8. List Top 5 tips to optimize DAX query manually (text explanation)

1. Use **variables (VAR)** to avoid recalculating the same expression multiple times.
2. Filter **only what's needed** using CALCULATE and FILTER.
3. Prefer **SUMX or AVERAGEX** over iterating entire tables unnecessarily.
4. Avoid ALL on large tables unless required.
5. Minimize **row context transitions** and use measures instead of calculated columns.

9. Benefit of using DAX optimization tools

- **DAX Studio** – Helps identify slow queries and analyze query plans.
- **Performance Analyzer** – Measures visuals' load times and detects bottlenecks.
- **Tabular Editor** – Simplifies model management and advanced optimization (like calculation groups).
